SUMMARY

I'm motivated by building software that solves real problems and delivers value to its users. During my Bachelor's and Master's in Computer Science, I developed strong theoretical and practical skills in software engineering, which allows me to build projects that people genuinely find useful.

EDUCATION

Master of Computer Science, *University of Hasselt* 09/2025 – 06/2028
Hasselt, Belgium

Bachelor Applied Computer Science - Major in AI, 09/2021 – 06/2024
Howest University of Applied Sciences - Cum laude Bruges, Belgium

EXPERIENCE

Ivago, *Student Worker - Routing & Fleet Data Management* 08/2026 – 09/2026
Ghent, Belgium

- Reorganized and corrected waste collection routing maps using ArcGIS Pro, QGIS, and internal routing software
- Automated data ingestion from external sources into internal databases
- Identified and blacklisted streets outside drivers' GPS trajectories, with early estimates suggesting up to a 10% improvement in routing accuracy

ML6, *Intern* 02/2024 – 05/2024
Ghent, Belgium

- Created 10+ Biology and AI components used for a Fondant pipeline with Docker
- Assisted with a full stack DBTL pipeline application
- Found and solved issues in the Fondant framework

SKILLS

HTML, CSS, JavaScript, Python, TypeScript, React, Java, PostgreSQL, MySQL, MongoDB, TensorFlow, Git, Linux, Docker, FastAPI

LANGUAGES

Dutch – Advanced, **Albanian** – Advanced, **English** – Advanced

PROJECTS

BrainRotTok 🔗, <https://github.com/Detopall/BrainRotTok/>

Built a platform that automatically generates TikTok-style videos by combining random clips with AI-generated subtitles. Developed with React (TypeScript) and FastAPI (Python), powered by Whisper for transcription. Deployed with Docker for seamless scalability, showcasing full-stack, AI, and media-processing skills. The project gained 21 GitHub stars.

Manga Panel Translator 🔗, <https://huggingface.co/spaces/DenisT/manga-translator/>

Built a platform that automates the translation of Japanese manga into English (or from/to any language) by detecting speech bubbles with YOLOv8, extracting and translating text, and replacing the original content. Designed a user-friendly interface with Gradio and hosted it on Hugging Face Spaces. Showcased skills in computer vision, NLP, and UI development. The project gained 18 GitHub stars, 29 likes on Hugging Face, and over 11,696 total visits.
